CLAIMS

WHAT IS CLAIMED:

- 1 1. A method for utilizing seismic data contemporaneously across multiple seismic
- domains, the method comprising kinematically linking a first point in a set of seismic data
- having at least three-dimensions in a first seismic domain with a second point in the set of
- 4 seismic data in a second seismic domain related to the first seismic domain by a velocity
- 5 model in time or in depth.
- 1 2. The method of claim 1, further comprising visualizing the first and second seismic
- 2 domains.
- 1 3. The method of claim 2, wherein kinematically linking the first point with the second
- point includes linking a cursor in the first seismic domain to a cursor in the second seismic
- 3 domain.
- 1 4. The method of claim 1, further comprising commonly navigating between the first
- and second seismic domains over the kinematic link.
- 1 5. The method of claim 1, further comprising interpreting the seismic data.
- 1 6. The method of claim 1, wherein:
- one of the first and second seismic domains comprises un-migrated post-stack time
- and the other one of the first and second seismic domains comprises post-stack
- 4 depth;
- one of the first and second seismic domains comprises migrated post-stack time and
- 6 the other one of the first and second seismic domains comprises post-stack
- 7 depth;
- 8 one of the first and second seismic domains comprises pre-stack time and the other
- one of the first and second seismic domains comprises depth;
- one of the first and second seismic domains comprises post-stack depth and the
- second seismic domain comprises depth;
- one of the first and second seismic domains comprises post-stack depth and the other
- one of the first and second seismic domains comprises re-migrated post-stack
- 14 depth;

- one of the first and second seismic domains comprises pre-stack time and the other one of the first and second seismic domains comprises pre-stack depth;
- one of the first and second seismic domains comprises raw pre-stack time and the
 other one of the first and second seismic domains comprises migrated prestack time;
- one of the first and second seismic domains comprises pre-stack acoustic and the
 other one of the first and second seismic domains comprises pre-stack
 converted; or
- one of the first and second seismic domains comprises a set of four-dimensional seismic data from a first vintage and the other one of the first and second seismic domains comprises a set of four-dimensional seismic data from a second vintage.
- 7. The method of claim 1, wherein the velocity model comprises an acoustic velocity model, an elastic velocity model, being they isotropic or an anisotropic velocity model.
- 1 8. The method of claim 1, wherein the dynamic conversion mechanism comprises a 2 vertical stretch, zero-offset conversion, image ray conversion, multi-offset conversion, elastic 3 conversion, or four-dimensional conversion type of mechanism.
- 9. The method of claim 1, wherein kinematically linking the first point to the second point includes applying a kinematic conversion mechanism of the same type as the dynamic conversion mechanism to the first point.
- 1 10. The method of claim 9, wherein the kinematic conversion mechanism comprises one 2 of a vertical stretch, a ray tracing, or an Eikonal wave front reconstruction.
- 1 11. The method of claim 1, further comprising pre-computing or computing on the fly a kinematic conversion between at least a portion of the data points in the first seismic and a portion of the data points in the second seismic domain.
- 1 12. The method of claim 1, further comprising kinematically linking the first point with a second point in the set of seismic data in a second seismic domain related to the first seismic domain by a velocity model in time or in depth.

- 1 13. The method of claim 1, wherein kinematically linking the first point with the second
- point comprises kinematically linking the first point point-to-point with the second point.
- 1 14. The method of claim 1, kinematically linking the first point with the second point
- 2 comprises kinematically linking the first point surface patch-by-surface patch with the second
- 3 point.
- 1 15. A program storage medium encoded with instructions that, when executed by a
- 2 computer, perform a method for utilizing seismic data contemporaneously across multiple
- seismic domains, the method comprising kinematically linking a first point in a set of seismic
- 4 data having at least three-dimensions in a first seismic domain with a second point in the set
- 5 of seismic data in a second seismic domain related to the first seismic domain by a velocity
- 6 model in time or in depth.
- 1 16. The program storage medium of claim 15, wherein the encoded method further
- 2 comprises visualizing the first and second seismic domains.
- 1 17. The program storage medium of claim 15, wherein the velocity model in the encoded
- method comprises an acoustic velocity model, an elastic velocity model, being they isotropic
- 3 or an anisotropic velocity model.
- 1 18. The program storage medium of claim 15, wherein the dynamic conversion
- 2 mechanism of the velocity model in the encoded method comprises a vertical stretch, zero-
- offset conversion, image ray conversion, multi-offset conversion, elastic conversion, or four-
- dimensional conversion type of mechanism.
- 1 19. The program storage medium of claim 15, wherein kinematically linking the first
- point to the second point in the encoded method includes applying a kinematic conversion
- mechanism of the same type as the dynamic conversion mechanism of the velocity model to
- 4 the first point.
- 1 20. The program storage medium of claim 15, wherein the encoded method further
- 2 comprises pre-computing or computing on the fly a kinematic conversion between at least a
- portion of the data points in the first seismic and a portion of the data points in the second
- 4 seismic domain.

- 1 21. The program storage medium of claim 15, wherein the encoded method further
- 2 comprises kinematically linking the first point with a second point in the set of seismic data
- 3 in a second seismic domain related to the first seismic domain by a velocity model in time or
- 4 in depth.
- 1 22. The program storage medium of claim 15, wherein kinematically linking the first
- 2 point with the second point in the encoded method comprises kinematically linking the first
- 3 point point-to-point with the second point.
- 1 23. The program storage medium of claim 15, kinematically linking the first point with
- 2 the second point in the encoded method comprises kinematically linking the first point
- 3 surface patch-by-surface patch with the second point.
- 1 24. A computer programmed to perform a method for utilizing seismic data
- 2 contemporaneously across multiple seismic domains, the method comprising kinematically
- 3 linking a first point in a set of seismic data having at least three-dimensions in a first seismic
- 4 domain with a second point in the set of seismic data in a second seismic domain related to
- 5 the first seismic domain by a velocity model in time or in depth.
- 1 25. The computer of claim 24, wherein the encoded method further comprises visualizing
- the first and second seismic domains.
- 1 26. The computer of claim 24, wherein the velocity model in the encoded method
- 2 comprises an acoustic velocity model, an elastic velocity model, being they isotropic or an
- 3 anisotropic velocity model.
- 1 27. The computer of claim 24, wherein the dynamic conversion mechanism of the
- 2 velocity model in the encoded method comprises a vertical stretch, zero-offset conversion,
- 3 image ray conversion, multi-offset conversion, elastic conversion, or four-dimensional
- 4 conversion type of mechanism.
- 1 28. The computer of claim 24, wherein kinematically linking the first point to the second
- 2 point in the encoded method includes applying a kinematic conversion mechanism of the
- 3 same type as the dynamic conversion mechanism of the velocity model to the first point.

- 1 29. The computer of claim 24, wherein the encoded method further comprises pre-
- 2 computing or computing on the fly a kinematic conversion between at least a portion of the
- data points in the first seismic and a portion of the data points in the second seismic domain.
- 1 30. The computer of claim 24, wherein the encoded method further comprises
- 2 kinematically linking the first point with a second point in the set of seismic data in a second
- 3 seismic domain related to the first seismic domain by a velocity model in time or in depth.
- 1 31. The computer of claim 24, wherein kinematically linking the first point with the
- 2 second point in the encoded method comprises kinematically linking the first point point-to-
- 3 point with the second point.
- 1 32. The computer of claim 24, kinematically linking the first point with the second point
- 2 in the encoded method comprises kinematically linking the first point surface patch-by-
- 3 surface patch with the second point.
- 1 33. A method for visualizing a set of seismic data in multiple seismic domains, comprising:
- visualizing the seismic data in a first seismic domain;
- visualizing the seismic data in a second seismic domain, the second seismic domain
- being related to the first seismic domain by a velocity model in time or depth
- and an appropriate conversion mechanism; and
- 7 kinematically linking the first and second seismic domains through a kinematic
- 8 conversion mechanism of the same type as the dynamic conversion
- 9 mechanism used to generate the second seismic data from the first seismic
- data based on the appropriate velocity model.
- 1 34. The method of claim 33, further comprising visualizing the first and second seismic
- 2 domains.
- 1 35. The method of claim 33, wherein the velocity model comprises an acoustic velocity
- 2 model, an elastic velocity model, being they isotropic or an anisotropic velocity model.
- 1 36. The method of claim 33, wherein the dynamic conversion mechanism comprises a
- vertical stretch, zero-offset conversion, image ray conversion, multi-offset conversion, elastic
- 3 conversion, or four-dimensional conversion type of mechanism.

- 1 37. The method of claim 33, wherein kinematically linking the first and second seismic
- domains includes applying a kinematic conversion mechanism of the same type as the
- dynamic conversion mechanism of the velocity model to the first seismic domain.
- 1 38. The method of claim 33, further comprising kinematically linking the first and second
- seismic domains in the set of seismic data in a second seismic domain related to the first
- seismic domain by a velocity model in time or in depth.
- 1 39. The method of claim 33, wherein kinematically linking the first and second seismic
- domains comprises kinematically linking the first seismic domain point-to-point with the
- 3 second seismic domain.
- 1 40. The method of claim 33, kinematically linking the first and second seismic domains
- 2 comprises kinematically linking the first seismic domain surface patch-by-surface patch with
- 3 the second seismic domain.
- 41. A method for detecting discrepancies in three-dimensional seismic data between multiple seismic domains thereof, comprising:
- kinematically linking a first seismic domain of the seismic data to a second seismic domain of the data;
- kinematically linking the second seismic domain to a third seismic domain and
- comparing the first seismic domain to the third seismic domain over the kinematic
- link between the first and second seismic domains and over the kinematic link
- between the second and third seismic domains; and
- detecting discrepancies between the first and third seismic domains as a consequence of the comparison.
- 1 42. The method of claim 41, further comprising visualizing the first seismic domain, the
- 2 second seismic domain, and the third seismic domain.
- 1 43. The method of claim 41, wherein linking the first and second seismic domains or
- linking the second and third seismic domains includes employing an acoustic velocity model,
- an elastic velocity model, being they isotropic or an anisotropic velocity model.
- 1 44. The method of claim 41, wherein the linking the first and second seismic domains or
- linking the second and third seismic domains includes employing a dynamic conversion

- 3 mechanism comprising a vertical stretch, zero-offset conversion, image ray conversion,
- 4 multi-offset conversion, elastic conversion, or four-dimensional conversion type of
- 5 mechanism.
- 1 45. The method of claim 41, wherein kinematically linking the first and second seismic
- domains includes applying a kinematic conversion mechanism of the same type as the
- 3 dynamic conversion mechanism of the velocity model to the first seismic domain.
- 1 46. The method of claim 41, further comprising kinematically linking the first and second
- 2 seismic domains in the set of seismic data in a second seismic domain related to the first
- 3 seismic domain by a velocity model in time or in depth.
- 1 47. The method of claim 41, wherein kinematically linking the first and second seismic
- domains comprises kinematically linking the first seismic domain point-to-point with the
- 3 second seismic domain.
- 1 48. The method of claim 41, kinematically linking the first and second seismic domains
- comprises kinematically linking the first seismic domain surface patch-by-surface patch with
- 3 the second seismic domain.
- 1 49. A method for accumulating complementary information extracted from multiple
- 2 seismic domains of a set of seismic data, comprising:
- interpreting a first seismic domain of the seismic data;
- kinematically linking the first seismic domain to a second seismic domain of the
- seismic data;
- 6 seeding the second seismic domain with the interpretation of the first seismic domain;
- hunting for complementary information in the second seismic domain; and
- persisting the complementary information to the first seismic domain.
- 1 50. The method of claim 49, further comprising visualizing the first and second seismic
- 2 domains.
- 1 51. The method of claim 49, wherein the velocity model comprises an acoustic velocity
- model, an elastic velocity model, being they isotropic or an anisotropic velocity model.

- 52. The method of claim 49, wherein the dynamic conversion mechanism comprises a
- vertical stretch, zero-offset conversion, image ray conversion, multi-offset conversion, elastic
- 3 conversion, or four-dimensional conversion type of mechanism.
- 1 53. The method of claim 49, wherein kinematically linking the first and second seismic
- 2 domains includes applying a kinematic conversion mechanism of the same type as the
- dynamic conversion mechanism of the velocity model to the first seismic domain.
- 1 54. The method of claim 49, further comprising kinematically linking the first and second
- 2 seismic domains in the set of seismic data in a second seismic domain related to the first
- 3 seismic domain by a velocity model in time or in depth.
- 1 55. The method of claim 49, wherein kinematically linking the first and second seismic
- domains comprises kinematically linking the first seismic domain point-to-point with the
- 3 second seismic domain.
- 1 56. The method of claim 49, kinematically linking the first and second seismic domains
- 2 comprises kinematically linking the first seismic domain surface patch-by-surface patch with
- 3 the second seismic domain.
- 1 57. The method of claim 49, further comprising:
- reinterpreting the first seismic domain of the seismic data, including the information
- persisted from the second seismic domain;
- kinematically linking the first seismic domain to a third seismic domain of the seismic
- 5 data;
- seeding the third seismic domain with the reinterpretation of the first seismic domain;
- hunting for additional complementary information in the third seismic domain; and
- persisting the additional complementary information to the first seismic domain.
- 1 58. A method for improving the exploitation of information extracted from a multi fold
- 2 seismic data, comprising:
- 3 kinematically linking a multi-fold seismic domain of the seismic data to an equivalent
- 4 one fold seismic domain;
- rearranging the data of the multi-fold seismic domain in light of the information
- 6 identified in the one fold seismic domain.

- 1 59. The method of claim 58, further comprising visualizing the multi-fold and single-fold
- 2 seismic domains.
- 1 60. The method of claim 58, wherein the velocity model comprises an acoustic velocity
- 2 model, an elastic velocity model, being they isotropic or an anisotropic velocity model.
- 1 61. The method of claim 58, wherein the dynamic conversion mechanism comprises a
- vertical stretch, zero-offset conversion, image ray conversion, multi-offset conversion, elastic
- 3 conversion, or four-dimensional conversion type of mechanism.
- 1 62. The method of claim 58, wherein kinematically linking the multi-fold and single-fold
- 2 seismic domains includes applying a kinematic conversion mechanism of the same type as
- the dynamic conversion mechanism of the velocity model to the multi-fold seismic domain.
- 1 63. The method of claim 58, further comprising kinematically linking the multi-fold and
- 2 single-fold seismic domains in the set of seismic data in a single-fold seismic domain related
- to the multi-fold seismic domain by a velocity model in time or in depth.
- 1 64. The method of claim 58, wherein kinematically linking the multi-fold and single-fold
- 2 seismic domains comprises kinematically linking the multi-fold seismic domain point-to-
- 3 point with the single-fold seismic domain.
- 1 65. The method of claim 58, kinematically linking the multi-fold and single-fold seismic
- 2 domains comprises kinematically linking the multi-fold seismic domain surface patch-by-
- 3 surface patch with the single-fold seismic domain.
